

ABSTRACT OF THE DISCLOSURE

In a process for mounting a plurality of parts to a cable in mounted positions and in mounted attitudes determined respectively for the parts, information for the mounting of each of parts is marked on the cable before mounting of the parts. Thus, the mounting of the parts can be carried out without selection of a worker, leading to an improved general-purpose property. Also, an exclusive jig is not required, resulting in a reduced cost and elimination of need to secure a space for storing the jig.
